

# **Analyzing STAR Data if You Are New to STAR: a MuDST Tutorial**

**Based on the excellent tutorials by Dan Magestro and Akio Agowa  
Updated to 2006**

**by  
Jim Thomas**

**Lawrence Berkeley National Laboratory  
October 10<sup>th</sup>, 2006**

# **If you are new to STAR but familiar with Root...**

---

- **STAR data analysis techniques use a few distinct styles and conventions that are unique to STAR ... but which are very powerful**
  - **Cons**
  - **Makers**
  - **$\mu$ DSTs**
  - **The Scheduler**

- STAR uses 'cons' to compile, link, and make files
  - You should create a sub-directory called 'StRoot' in your primary work area
    - Create a sub-directory called 'HelloWorld' under 'StRoot'
      - Put 'HelloWorld.cxx' and 'HelloWorld.h' into 'StRoot/HelloWorld/'
  - Now type 'cons' from your primary directory and your files will be automatically compiled and linked
    - No Make files! Somebody else does all that work for you ...
    - This works even if your files refer to other STAR or ROOT software
- You can change the version of root, the compilers, and cons
  - The command 'starpro' issued at the command line will give you the production version of all STAR software
  - Similarly, 'starold', 'starnew', and 'stardev' give the newest stable version of the software or the developmental version of the software.
  - A specific version of older star software can be achieved with the 'starver' command (ie. 'starver SL06e' )

# Check out your own copy of STAR Software

- You can checkout your own copy of STAR software, change it, cons it, and 'root4star' will use the local copy in your StRoot area before using the global STAR copy of that library
  - From your primary directory, execute the following command
    - > **cv**s co **StRoot/StMuDSTMaker**  
(p.s. note capitalization of DST)
  - This will create the StRoot sub-directory and fill it with all of the StMuDstMaker routines. You can now compile the software
    - > **stardev** ← cvs contains the latest software that may only compile in dev
    - > **cons**
  - The local copy of the files (and your changes) in StRoot/StMuDSTMaker will be the default until you delete the directory.
    - You may not want this result ... so check out software wisely
- STAR offline software is documented in CVS & D'Oxygen
  - CVS: <http://www.star.bnl.gov/cgi-bin/cvsweb.cgi/StRoot/>
  - D'Ox: <http://www.star.bnl.gov/webdatanfs/dox/html/classes.html>
  - These links can be found from homepage => computing => offline docs

- **STAR analysis software uses ‘Makers’**
  - For our purposes, this is a recommended style for structuring your event analysis programs
  - A Maker has three required member functions
    - **Init()**
    - **Make()**
    - **Finish()**
  - You can do elegant things with Makers, including chaining several of them together, but for now we will introduce the style
- **The elements of the “HelloWorldMaker.cxx”**

```
Int_t HelloWorldMaker::Init( )  
  { // Do once at the start of the analysis, create histograms, etc. }
```

```
Int_t HelloWorldMaker::Make( )  
  { // Do every event  
    cout << "Hello World" << end ;  
    return kStOK ;  }
```

```
Int_t HelloWorldMaker::Finish( )  
  { // Do once at the end of the analysis, close files, etc. }
```

# Execute the Maker from a macro like this ...

```
void HelloWorld( )
{
    // Load libraries
    gROOT  -> Macro("loadMuDst.C")
    gSystem -> Load("HelloWorldMaker.so") ;

    // List of member links in the chain
    StChain* chain = new StChain ;
    HelloWorldMaker* Hello = new HelloWorldMaker( ) ;

    Int_t nEvents = 10 ;

    // Loop over the links in the chain
    chain -> Init() ;
    chain -> EventLoop(1,nEvents) ;
    chain -> Finish() ;

    // Cleanup
    delete chain ;
}
```

} You can make a list of several makers

} and they will be executed, in order, here.

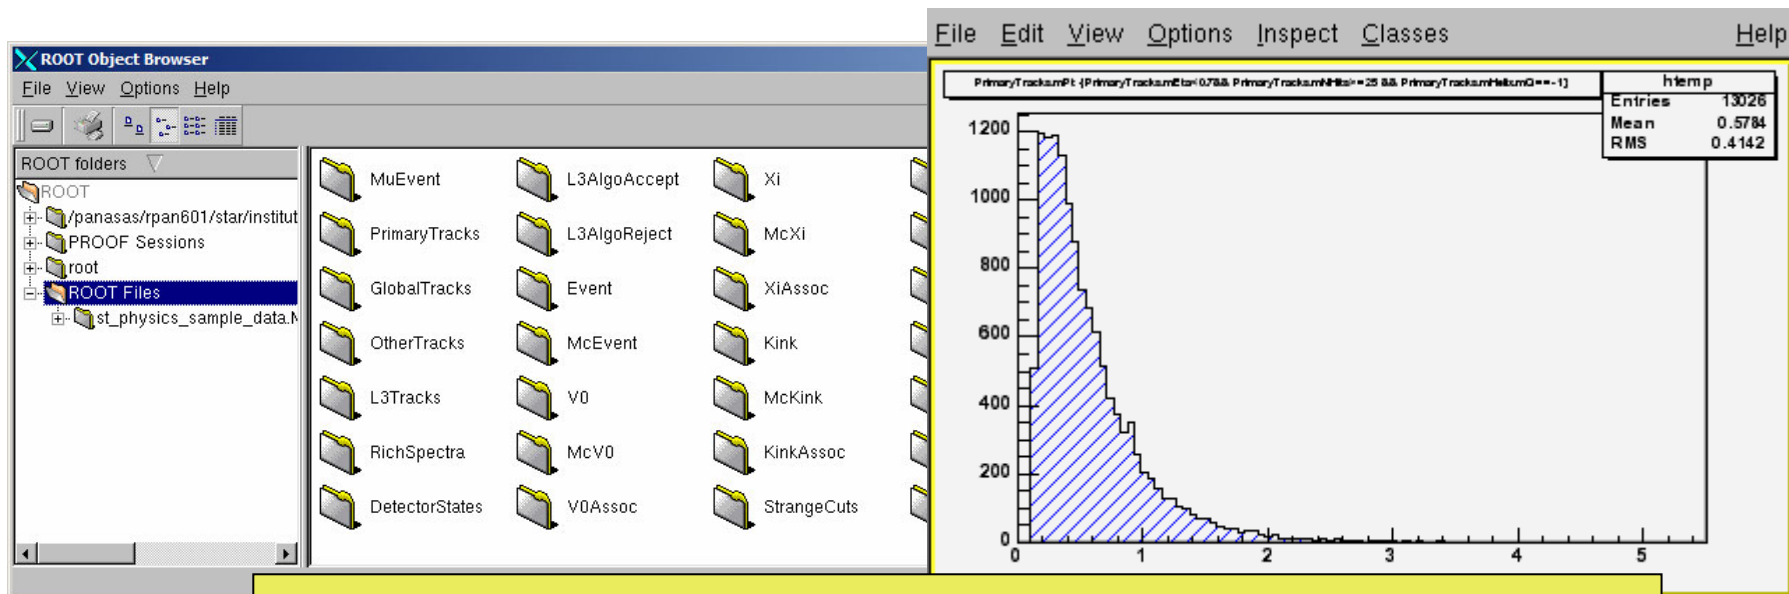

Full example at rcf: </star/institutions/lbl/jthomas/muDstTutorial/HelloWorldExample>

# How Do I Read a STAR Data Tape?

- One way is to open a MuDst file, a TBrowser, and off you go
  - Fast way to read the data (just requested quantities are read)
  - Good for quick checks, data sanity, etc.
  - TChains of TFiles can be used to increase stats (not shown here)

```
root[0] TFile f("st_physics_sample_data.MuDst.root")
root[1] TBrowser b
root[2] MuDst->Draw("PrimaryTracks.mPt", "PrimaryTracks.mEta<0.7 &&
PrimaryTracks.mNHits>=25 && PrimaryTracks.mHelix.mQ== -1")
<TCanvas::MakeDefCanvas>: created default TCanvas with name c1
```

# A Better Way to Read a MuDst

- Let StMuDstMaker do the work for you
  - StMuDstMaker handles all IO
  - All event and track information is accessed with simple class methods
  - Read only the data you want without wasting time ... no need for picoDSTs
    - Example: you can read the primary tracks and skip over the global tracks without paying an IO penalty
  - Essential for physics analysis with multiple primary vertices ( $\geq 2005$ )

```
StMuDstMaker *muDstMaker = new StMuDstMaker( int mode,  
                                              int nameMode,  
                                              const char *dirName="./",  
                                              const char *fileName="",  
                                              const char *filter=".",  
                                              int maxfiles=10,  
                                              const char *name="MuDst" )
```

# Commonly used branches, methods

## GlobalTracks, PrimaryTracks

track quantities {  
vectors and helices {  
calculated pid quantities {

```
StMuTrack *muTrack = (StMuTrack*) GetTracks.Next();  
  
muTrack->eta()           // pseudorapidity  
muTrack->phi()           // az.angle (radians)  
muTrack->pt()            // transverse mom.  
muTrack->charge()        // +1 or -1  
muTrack->nHits()          // TPC hits  
muTrack->nHitsFit()      // TPC hits used in fit  
[...]  
  
muTrack->dcaGlobal()     // StThreeVectorF  
muTrack->momentum()      // StThreeVectorF  
muTrack->helix()         // StPhysicalHelixD  
[...]  
  
muTrack->pidProbPion()   // 0. <= pidProb <= 1.0  
muTrack->nSigmaKaon()    // nSigma (bethe-bloch)  
[...]
```

## MuEvent

event-wise quantities {  
detector- and trigger-wise  
collections {

```
StMuEvent *muEvent = mMuDstMaker->muDst()->event();  
  
muEvent->refMult()  
muEvent->primaryVertexPosition().z()  
muEvent->magneticField()  
muEvent->ctbMultiplicity()  
  
muEvent->triggerIdCollection()  
muEvent->fpdCollection()
```

# Instantiating StMuDstMaker

- StMuDstMaker can take file lists in many formats
  - Contents of a directory
  - Lists of files
  - Filename filtering possible

```
StMuDstMaker *muDstMaker = new StMuDstMaker( int mode,  
                                              int nameMode,  
                                              const char *dirName="./",  
                                              const char *fileName="",  
                                              const char *filter=".",  
                                              int maxfiles=10,  
                                              const char *name="MuDst" )
```

- Using the STAR scheduler is the best way to create the filelists:
  - Instantiate after creating an StChain:

```
StMuDstMaker *muDstMaker = new StMuDstMaker(0,0,"",inFile,"",100)
```

# Using StMuDstMaker in a Macro

```
void MacroExample( Int_t nFiles, Char_t InputFileList[256] )
{
  // Load Libraries
  gROOT -> Macro("loadMuDst.C")
  // Create Histograms
  TCanvas*   nCanvas[2] ;
  TH1F*     histogram[2] ;
  ...
  // Run the muDstMaker
  StMuDstMaker* maker = new StMuDstMaker(0,0,"",InputFileList,"MuDst",nFiles) ;
  while ( !maker->Make() )
  {
    // Do 'event' analysis based on event pointers
    StMuEvent* muEvent      = maker -> muDst()-> event() ;
    histogram[0] -> Fill( muEvent -> primaryVertexPosition().z() ) ;
    // Get 'track' data, make cuts on tracks, do physics analysis
    TObjArray* tracks = maker -> muDst()-> primaryTracks() ;
    TObjArrayIter GetTracks(tracks) ;
    StMuTrack* track ;
    while ( ( track = (StMuTrack*)GetTracks.Next() ) ) // Main loop for Iterating
    {
      histogram[1] -> Fill( track->pt() ) ;
    }
  }
  // Finish using the muDSTmaker
  ...
  histogram[0] -> Draw() ;
  histogram[1] -> Draw() ;
}
```

This could be in the Init()  
function of a maker

Analyze 'event'  
data

Analyze 'track' data

This could be in the Finish()  
function of a maker

# Using StMuDstMaker in a Chain

```
void SimpleAnalysis(Int_t nEvents, Int_t nFiles, TString InputFileList,
                   TString OutputDir, TString JobIdName )
{
  // Load libraries
  gROOT -> Macro("loadMuDst.C")
  gSystem -> Load("SimpleAnalysis.so") ;

  // List of member links in the chain
  StChain*          chain = new StChain ;
  StMuDstMaker* muDstMaker = new StMuDstMaker(0,0,"",InputFileList,"MuDst",nFiles) ;
  SimpleAnalysisMaker* AnalysisCode = new SimpleAnalysisMaker(muDstMaker) ;

  ...

  // Loop over the links in the chain
  chain -> Init() ;
  chain -> EventLoop(1,nEvents) ;
  chain -> Finish() ;

  // Cleanup
  delete chain ;
}
```

← Precompile your analysis Maker using 'cons'

↑ Your analysis Maker in the chain

Full example at rcf: </star/institutions/lbl/jthomas/muDstTutorial/SimpleAnalysisExample>

- The strategy for SimpleAnalysisMaker

**Constructor:** Pass pointer to StMuDstMaker object

**Init():** Instantiate & define histograms

every event { **Make():** Get pointers to StMuEvent & StMuTrack for current event, apply event cuts, loop over tracks, apply track cuts, & fill histograms

**Clear():** Do nothing (some analyses may clear collections, etc.)

**Finish():** Write histograms to file, print information to stdout

# SimpleAnalysisMaker.h

```
#ifndef SimpleAnalysisMaker_def
#define SimpleAnalysisMaker_def

#include "StMaker.h"
#include "TString.h"

class StMuDstMaker ;
class TFile ;
class TH1F ;

#define MaxNumberOfTH1F 10

class SimpleAnalysisMaker : public StMaker
{
private:
    StMuDstMaker* mMuDstMaker ;
    TH1F*          histogram[MaxNumberOfTH1F] ;
    TFile*         histogram_output ;
    UInt_t         mEventsProcessed ;
    TString        mHistogramOutputFileName ;

public:
    SimpleAnalysisMaker(StMuDstMaker* maker) ;
    virtual ~SimpleAnalysisMaker( ) ;

    Int_t Init ( ) ;
    Int_t Make ( ) ;
    Int_t Finish ( ) ;

    void SetOutputFileName(TString name) {mHistogramOutputFileName = name;}
    ClassDef(SimpleAnalysisMaker,1)
};

#endif
```

Unique to this analysis

Generic to all analyses

```
ClassImp(SimpleAnalysisMaker) // Macro for CINT compatibility

SimpleAnalysisMaker::SimpleAnalysisMaker( StMuDstMaker* maker ) : StMaker()
{
  for ( Int_t i = 0 ; i < NumberOfTH1F ; i++ ) { histogram[i] = NULL ; }
  mMuDstMaker      = maker ; // Pass MuDst pointer
  histogram_output = NULL ; // Zero the Pointer to output file
  mEventsProcessed = 0 ; // Zero the Number of Events
  mHistogramOutputFileName = "" ; // Histogram Output File Name
}

Int_t SimpleAnalysisMaker::Init( ) ← Create histograms
{
  histogram_output = new TFile( mHistogramOutputFileName, "recreate" ) ;
  const Int_t nbins = 100 ;
  histogram[0] = new TH1F( "Vertex", "Vertex Z Position", nbins, -25.0, 25.0 ) ;
  histogram[1] = new TH1F( "Pt", "Transverse Momentum", nbins, 0, 10 ) ;
  return kStOK ;
}

Int_t SimpleAnalysisMaker::Finish( ) ← Write histograms, close files, etc.
{
  histogram_output -> Write() ;
  cout << "Total Events Processed in DstMaker " << mEventsProcessed << endl ;
  return kStOk ;
}
```

# SimpleAnalysisMaker.cxx (continued)

```
Int_t SimpleAnalysisMaker::Make( )
{
  // Get 'event' data

  StMuEvent* muEvent      = mMuDstMaker -> muDst()-> event() ;
  histogram[0] -> Fill( muEvent->primaryVertexPosition().z() ) ;
  // Get 'track' data, make cuts on tracks, do physics analysis

  TObjArray* tracks = mMuDstMaker -> muDst()-> primaryTracks() ;
  TObjArrayIter GetTracks(tracks) ;
  StMuTrack* track ;

  while ( ( track = (StMuTrack*)GetTracks.Next() ) )
  {
    histogram[1] -> Fill( track->pt() ) ;
  }

  mEventsProcessed++ ;
  return kStOK ;
}
```

} Analyze 'event' data

// Create an iterator  
// Pointer to a track

// Main loop for Iterating  
} Analyze 'track' data

```
Int_t BiggerAnalysisMaker::Make( )

{
  // Get 'event' data
  StMuEvent* muEvent      = mMuDstMaker->muDst()->event() ;
  histogram[0] -> Fill( muEvent->primaryVertexPosition().z() ) ;

  // Get 'track' data, make cuts on tracks, do physics analysis.
  TObjArray* tracks = mMuDstMaker->muDst()->primaryTracks() ;
  TObjArrayIter GetTracks(tracks) ;
  StMuTrack* track ;

  while ( ( track = (StMuTrack*)GetTracks.Next() ) )
    { histogram[1] -> Fill( track->pt() ) ; }

  // Option - you can store the tracks in a TList and do physics analysis
  // on the TList. This is a good way to do pairwise analyses.

  TList HighPtTracks ;
  GetTracks.Reset() ;
  while ( ( track = (StMuTrack*)GetTracks.Next() ) )
    { if ( track->pt() >= 2.0 ) HighPtTracks.Add(track) ; }

  TListIter GetHighPtTracks(&HighPtTracks) ;
  StMuTrack* listedtrack ;
  while ( ( listedtrack = (StMuTrack*)GetHighPtTracks.Next() ) )
    { histogram[2] -> Fill ( listedtrack->pt() ) ; }

  mEventsProcessed++ ;
  return kStOK ;
}
```

First pass at physics analysis

Create list and save selected tracks

Physics analysis on saved tracks

- **Q: Where do I get a list of files to run through my macro?**
  - **A: Don't**
- **STAR data files are so large that it is very inefficient to maintain a list of files and to run that list through a single CPU**
  - **The network is the bottleneck**
  - **For example: the run 4 DSTs use 40 TB of disk space and the disks will fail if you try to move a significant fraction of this around the farm**
- **It is better to move your job to the data**
  - **The STAR  $\mu$ DSTs are stored on local disks at RCF**
  - **You can send your job to the CPU where the data is stored**
    - **This is a very efficient use of the network because only your histograms have to come back over the network**
- **The STAR Scheduler does this for you automatically**

# The Scheduler builds the list of files

- The Scheduler builds the lists of files based on a query to the file catalogue to determine what you want. You can do this from the command line:
  - > `get_file_list.pl -keys path,filename -cond filetype=daq_reco_mudst, trgsetupname=ProductionCentral,collision=AuAu200,sanity=1,storage=NFS`
- Or you can do it with a script. A sample .xml file to coordinate the file catalogue query and the submission of your job might look like this:

```
<?xml version="1.0" encoding="utf-8" ?>
<job maxFilesPerProcess="10" fileListSyntax="xrootd" >

<command>
  starpro
  root4star -q -b SimpleAnalysis.C\(0,$INPUTFILECOUNT,\"$FILELIST\", \"$SCRATCH\", \"$JOBID\")
</command>

<SandBox installer="ZIP">
  <Package>
    <File>file:./SimpleAnalysis.C</File>
    <File>file:./StRoot</File>
  </Package>
</SandBox>

<input
  URL="catalog:star.bnl.gov?filetype=daq_reco_mudst,trgsetupname=productionCentral,sanity=1,storage=NFS"
  nFiles="2" />

<stdout URL="file:./$JOBID.out"/>
<stderr URL="file:./$JOBID.err"/>
<output fromScratch="*.root" toURL="file:/star/institutions/lbl/jthomas/muDstTutorial/SimpleExample/" />

</job>
```

# Putting it all together ...

~home/SimpleAnalysisExample

SimpleAnalysis.xml, SimpleAnalysis.C, StRoot

~home/SimpleAnalysisExample/StRoot

SimpleAnalysis

~home/SimpleAnalysisExample/StRoot/SimpleAnalysis

SimpleAnalysisMaker.cxx, SimpleAnalysisMaker.h

- In order to do STAR data analysis, you have 4 files to build

- SimpleAnalysis.xml ← Query the file catalogue
- SimpleAnalysis.C ← Put makers in a 'chain'
- SimpleAnalysisMaker.cxx } Do physics analysis
- SimpleAnalysisMaker.h }

- Submit your analysis request to the farm using these commands

- > star-submit SimpleAnalysis.xml
- > bjobs
- > bkill

# Additional Topics

- Recommended cuts on the data for a 'typical' analysis

Cuts on event information:

`muEvent->refMult()` // Centrality determination  
`muEvent->primaryVertexPosition()` // Not equal to (0,0,0) for older daq files  
`mMuDstMaker->muDst()->numberOfPrimaryVertices()` // == 0,1 for new files

Cuts on track quality:

`muTrack->dcaGlobal().mag()` < 2 cm  
`muTrack->flag()` ≥ 0  
`muTrack->nHits()` > 15  
`muTrack->eta()` < 1.0

For additional details about the data:

[http://www.star.bnl.gov/STAR/html/all\\_l/index.html](http://www.star.bnl.gov/STAR/html/all_l/index.html)

<http://www.star.bnl.gov/STAR/comp/prod/ProdList.html>

and most important ... talk to your colleagues to get their advice

- Note that the  $\mu$ DST files use structures that are unique to STAR
  - **StThreeVectorF**  
is a three vector that can be used to take dot products, cross products and several other very useful functions
  - **StPhysicalHelixD**  
is a state vector containing the parameters of a helix
  - Etcetera, etcetera
- These are classes from the StarClass Library
  - **SCL** is a very comprehensive library of tools and beautifully written
  - <http://rhicii-science.bnl.gov/STAR/comp/pkg/dev/StRoot/StarClassLibrary/README>
- ROOT has equivalent classes that do the same thing
  - **TVector3** is essentially identical to **StThreeVectorF**, etc.
  - **ROOT** was a primitive beast at the time the StarClass Library was written and it did not have ThreeVectors. So we wrote our own.

There is no way to change the fact that we use the StarClassLibrary and so you must have it, and use it, in order to analyze STAR data.
