Note: SN006 was installed at STAR in 2018 as Sector 20 Inner. This sector is also known as "Article 3".

Orientation

The Coordinate system uses the center line of the sector to define the Y axis. See photo.

The X axis crosses the Y axis at a point that is slightly above the center of pad row 40 but not as high as the top of pad row 40. To be precise, the origin lies 5.65 mm above the center of pad row 40. Another way to locate the origin is to say it is 1187.65 mm from the beamline; or 668.60 mm above the bottom edge (narrow end) of the sector.

The origin lies directly over the primary tooling ball (on the wide end of the sector) that aligns the sector with the TPC end wheel. There is another tooling ball that is near the narrow end of the sector. It is also on the centerline of the sector. The distance between the primary and secondary tooling balls is 642.11 mm.

The pad plane is displaced from its nominal position by (dX, dY) and rotated by an angle θ .

The angle of rotation is about the origin of the coordinate system. The angle of the padplane (the padrows) is measured with respect to the X axis and a positive rotation is counter-clockwise.

The pad plane is stretched (or shrunk) along the X axis and the Y axis. The amount of stretch (or shrinkage) is given by ScaleX and ScaleY factors. Positive values mean the padplane was stretched during its manufacturing process.

$$\begin{pmatrix} X_{pad} \\ Y_{pad} \end{pmatrix} = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix} \begin{pmatrix} X * (1 + X_{scale}) \\ Y * (1 + Y_{scale}) \end{pmatrix} + \begin{pmatrix} dX \\ dY \end{pmatrix}$$

Small angle approximations (good to sub-micron level):

$$\begin{aligned} X_{Pad} &= X(1 + X_{scale}) + dX - \theta * Y \\ Y_{Pad} &= Y(1 + Y_{scale}) + dY + \theta * X \end{aligned}$$

or

$$\begin{aligned} X &= X_{Pad}(1 - X_{scale}) - dX + \theta * Y_{Pad} \\ Y &= Y_{Pad}(1 - Y_{scale}) - dY - \theta * X_{Pad} \end{aligned}$$

One more useful thing to know is that the number of Pads per Row (PPR) in the iTPC is:

$$PPR = 2 * \left[Row + 25 - \text{Integer} \left(\frac{Row}{7} \right) \right]$$

Example: Suppose that we observe a "hit" on Pad 114 in Row 38 (see photo for definition of Row Number and Pad Number)

$$\begin{aligned} X_{hit} &= \left(Pad - \frac{PPR}{2} - 1/2 \right) * 5mm * (1 + X_{scale}) + dX \\ &\quad - \theta * [(Row - 40) * 16mm - 5.65mm] \end{aligned}$$

and

$$\begin{aligned} Y_{hit} &= [(Row - 40) * 16mm - 5.65mm] * (1 + Y_{scale}) + dY \\ &\quad + \theta * \left(Pad - \frac{PPR}{2} - 1/2 \right) * 5mm \end{aligned}$$

where X_{hit} and Y_{hit} are the coordinates of the hit in the STAR global coordinate system (after
